4 primitive variables

String

int

double

bool

— true

— false

```
//variables
```

```
String sentence='my favorite symbol is " and I love it so much ';
```

```
String sentence2="my favorite \\ symbol \\n is \" and I love it so much \";
```

```
print(sentence);
```

```
print(sentence2);
```

```
int birthYear;
```

```
birthYear=1981;
```

```
int age=40;
```

```
String name="mustafa", surname="coskun";
```

```
double interestRate=10.5;
```

```
print(name + " " +surname);
```

```
print("my age is " + age.toString());
```

```
bool isLogin= false; //true
```

```
//camelCase
```

```
//SnakeCase
```

hot reload → cmd + S

hot restart

deplow (run)

scaffold → popular widget

```
import 'package:flutter/material.dart';

void main(){
  //String message="my new app";

  //intellisense can come with ctrl+space
  //when you write runApp
  // import 'package:flutter/cupertino.dart'; comes -->IOS design interface
  //but choose material.dart -->Android design interface
  //but both are just about design issues
  runApp(MaterialApp(
    home:Scaffold(
      appBar: AppBar(
        title: Text("Hello my first application!22222"),
        //title: Text(message),
      ),
      body: Center( //centers the insiders
        child: Text("body part"), //since I changed the widget tree hot reload possibly not work
      ),
    ), //this is a property, running code block widget
    //Scaffold is a widget most popular
  ));
  //use MaterialApp class, this creates a workspace with material standards
}
```

first
practice

```
import 'package:flutter/cupertino.dart'; //for IOS Design
import 'package:flutter/material.dart'; // for Android Design
```

```
void main(){
```

```
  //intellisense
  runApp(MaterialApp(
    home: MyApp()
  ));
}
```

```
class MyApp extends StatelessWidget{
  int year=1981;
  String myTitle="how are you";
  String myText="here is my body text";
  @override
  Widget build(BuildContext context) {
    return Scaffold(
      appBar: AppBar(
        title: Text(myTitle),
      ),
      body: Center(
        child: ElevatedButton(
          onPressed: (){
            String message="";
            if(year<1990)
              message="you are soo old";
            else
              message="my young friend";
            var alert=AlertDialog(
              title: Text("Result"),
              content: Text(message)
            );
            showDialog(context: context, builder: (BuildContext)=>alert);
          },
          child: Text("Please click on me")
        ),
      ),
    );
    throw UnimplementedError();
  }
}
```
